Abstract

This research examines the effectiveness of the current solid waste management practices implemented across Manila City. Data were collected through waste collection reports, barangay inspections, environmental surveys, and interviews with local officials.

The findings indicate that inconsistent waste segregation, illegal dumping, limited recycling facilities, and low public awareness remain major challenges affecting waste management efficiency.

The study proposes strengthening waste segregation programs, expanding recycling centers, conducting environmental education campaigns, increasing penalties for illegal dumping, and adopting digital waste monitoring systems.

These recommendations aim to improve environmental cleanliness, reduce pollution, increase recycling rates, and support sustainable urban development throughout Manila City.
