Urban Traffic Congestion Study in Manila City

Author

City Planning Office

Date

July 28, 2026

Abstract

This study examines the increasing traffic congestion within Manila City. Daily traffic delays affect commuters, businesses, and emergency services. Data were collected through traffic volume surveys, GPS monitoring, and public transportation reports.

The study found that major congestion occurs during morning and evening rush hours. The primary causes include insufficient road capacity, illegal parking, inefficient traffic signal timing, and increasing private vehicle ownership.

Several recommendations are proposed, including synchronized traffic signal systems, expansion of public transportation, stricter enforcement of parking regulations, and implementation of smart traffic management technologies.

Improving traffic efficiency is expected to reduce travel time, improve economic productivity, and decrease environmental pollution.
