

Title

Public Transportation Efficiency Improvement Plan for Manila City

Author

Manila City Transportation Management Office

Date

August 28, 2026

Abstract

This research evaluates the current public transportation conditions and identifies factors affecting transportation efficiency throughout Manila City. Data were collected through passenger surveys, traffic observations, transportation records, and interviews with commuters and local transportation personnel.

The findings indicate that traffic congestion, overcrowding, inconsistent vehicle schedules, limited passenger information, and inefficient traffic management remain major challenges affecting public transportation services.

The study proposes improving public transportation scheduling, optimizing traffic management strategies, establishing digital passenger information systems, improving designated loading and unloading areas, and strengthening monitoring of transportation operations.

These recommendations aim to reduce travel delays, improve commuter convenience, enhance transportation efficiency, and support a more accessible and sustainable public transportation system throughout Manila City.
