

Title

Improvement Strategy for Public Health Services in Manila City

Author

Manila City Health Department

Date

August 28, 2026

Abstract

This research evaluates the accessibility and effectiveness of public health services provided in different communities throughout Manila City. Data were collected through health center records, community surveys, patient feedback, and interviews with healthcare personnel.

The findings indicate that overcrowded health facilities, limited medical resources, long waiting times, and uneven access to healthcare services remain major challenges affecting public health service delivery.

The study proposes improving health facility capacity, increasing essential medical resources, implementing digital appointment systems, strengthening community health programs, and improving patient information services.

These recommendations aim to improve healthcare accessibility, reduce waiting times, enhance service delivery, and promote better health outcomes for residents throughout Manila City.
